研究背景	HIV-1, the causative agent of acquired immunodeficiency syndrome (AIDS), contains an RNA genome that produces a chromosomally integrated DNA during the replicative cycle. Activation of HIV-1 gene expressi on by the transactivator Tat is dependent on an RNA regulatory element (TAR) located downstream of the transcription initiation site. The protein encoded by this gene is a transcriptional repressor that binds to c hromosomally integrated TAR DNA and represses HIV-1 transcription. In addition, this protein regulates al ternate splicing of the CFTR gene. A similar pseudogene is present on chromosome 20.
