研究背景	This gene encodes a member of the DNAJ protein family. DNAJ family members are characterized by a hig hly conserved amino acid stretch called the 'J-domain' and function as one of the two major classes of mo lecular chaperones involved in a wide range of cellular events, such as protein folding and oligomeric pro tein complex assembly. This family member may also play a role in polyglutamine aggregation in specific neurons. Alternative splicing of this gene results in multiple transcript variants; however, not all variants have been fully described.
