研究背景	The protein encoded by this gene is a member of the interleukin 1 cytokine family. This protein inhibits th e activities of interleukin 1, alpha (IL1A) and interleukin 1, beta (IL1B), and modulates a variety of interle ukin 1 related immune and inflammatory responses. This gene and five other closely related cytokine ge nes form a gene cluster spanning approximately 400 kb on chromosome 2. A polymorphism of this gene i s reported to be associated with increased risk of osteoporotic fractures and gastric cancer. Several altern atively spliced transcript variants encoding distinct isoforms have been reported.
