研究背景	The protein encoded by this gene is the receptor for colony stimulating factor 1, a cytokine which control s the production, differentiation, and function of macrophages. This receptor mediates most if not all of th e biological effects of this cytokine. Ligand binding activates the receptor kinase through a process of olig omerization and transphosphorylation. The encoded protein is a tyrosine kinase transmembrane receptor and member of the CSF1/PDGF receptor family of tyrosine-protein kinases. Mutations in this gene have b een associated with a predisposition to myeloid malignancy. The first intron of this gene contains a transc riptionally inactive ribosomal protein L7 processed pseudogene oriented in the opposite direction. Alterna tive splicing results in multiple transcript variants. Expression of a splice variant from an LTR promoter ha s been found in Hodgkin lymphoma (HL), HL cell lines and anaplastic large cell lymphoma.
