研究背景	DEAD box proteins, characterized by the conserved motif Asp-Glu-Ala-Asp (DEAD), are putative RNA helic ases. They are implicated in a number of cellular processes involving alteration of RNA secondary structu re such as translation initiation, nuclear and mitochondrial splicing, and ribosome and spliceosome asse mbly. Based on their distribution patterns, some members of this family are believed to be involved in em bryogenesis, spermatogenesis, and cellular growth and division. This gene encodes a DEAD box protein, which is a homolog of VASA proteins in Drosophila and several other species. The gene is specifically expr essed in the germ cell lineage in both sexes and functions in germ cell development. Multiple transcript v ariants encoding different isoforms have been found for this gene.
