研究背景	This gene encodes a subunit of the BRCA1-BRCA2-containing complex (BRCC), which is an E3 ubiquitin lig ase. This complex plays a role in the DNA damage response, where it is responsible for the stable accum ulation of BRCA1 at DNA break sites. The component encoded by this gene can specifically cleave Lys 63- linked polyubiquitin chains, and it regulates the abundance of these polyubiquitin chains in chromatin. Th e loss of this gene results in abnormal angiogenesis and is associated with syndromic moyamoya, a cereb rovascular angiopathy. Alternative splicing results in multiple transcript variants. A related pseudogene h as been identified on chromosome 5.
