研究背景	This gene encodes the fatty acid binding protein found in epidermal cells, and was first identified as bein g upregulated in psoriasis tissue. Fatty acid binding proteins are a family of small, highly conserved, cyto plasmic proteins that bind long-chain fatty acids and other hydrophobic ligands. FABPs may play roles in f atty acid uptake, transport, and metabolism. Polymorphisms in this gene are associated with type 2 diabe tes. The human genome contains many pseudogenes similar to this locus.
