靶点信息

研究背景	The protein encoded by this gene is a glycoprotein, belonging to the pentraxin family of proteins, which has a characteristic pentameric organization. These family members have considerable sequence homology which is thought to be the result of gene duplication. The binding of the encoded protein to proteins in the pathological amyloid cross-beta fold suggests its possible role as a chaperone. This protein is also thought to control the degradation of chromatin. It has been demonstrated that this protein binds to apoptotic cells at an early stage, which raises the possibility that it is involved in dealing with apoptotic cells in vivo.

Detailed description: A Western blot image showing a single prominent band at approximately 25 kDa. The molecular weight markers are listed on the left side of the blot, ranging from 10 kDa to 250 kDa in increments of 25 kDa. The band at 25 kDa is indicated by a small arrowhead pointing to the right.
