## 靶点信息

研究背景	The protein encoded by this gene is a metalloprotein that binds most of the copper in plasma and is involved in the peroxidation of Fe(II)transferrin to Fe(III) transferrin. Mutations in this gene cause aceruloplasminemia, which results in iron accumulation and tissue damage, and is associated with diabetes and neurological abnormalities. Two transcript variants, one protein-coding and the other not protein-coding, have been found for this gene.
