靶点信息

研究背景	This gene, a member of the SNAP25 gene family, encodes a protein involved in multiple membrane traffi cking steps. Two other members of this gene family, SNAP23 and SNAP25, encode proteins that bind a sy ntaxin protein and mediate synaptic vesicle membrane docking and fusion to the plasma membrane. The protein encoded by this gene binds tightly to multiple syntaxins and is localized to intracellular membran e structures rather than to the plasma membrane. While the protein is mostly membrane-bound, a signifi cant fraction of it is found free in the cytoplasm. Use of multiple polyadenylation sites has been noted for this gene.
