靶点信息

研究背景	This gene encodes a member of the peptidase family. The protein forms a homodimer that hydrolyzes dipptides or tripeptides with C-terminal proline or hydroxyproline residues. The enzyme serves an important role in the recycling of proline, and may be rate limiting for the production of collagen. Mutations in this gene result in prolydase deficiency, which is characterized by the excretion of large amount of di- and tripeptides containing proline. Multiple transcript variants encoding different isoforms have been found for this gene.
