靶点信息

研究背景	This gene encodes an estrogen receptor, a ligand-activated transcription factor composed of several dom ains important for hormone binding, DNA binding, and activation of transcription. The protein localizes to the nucleus where it may form a homodimer or a heterodimer with estrogen receptor 2. Estrogen and its receptors are essential for sexual development and reproductive function, but also play a role in other tis sues such as bone. Estrogen receptors are also involved in pathological processes including breast cance r, endometrial cancer, and osteoporosis. Alternative promoter usage and alternative splicing result in doz ens of transcript variants, but the full-length nature of many of these variants has not been determined.
