## 靶点信息

|       |   |
|-------|---|
| 研究背景  | The protein encoded by this gene has a long and a short form, generated by use of alternative translation start codons. The long form is expressed in steroidogenic tissues such as testis, where it converts cholesterol esters to free cholesterol for steroid hormone production. The short form is expressed in adipose tissue, among others, where it hydrolyzes stored triglycerides to free fatty acids. |
