靶点信息

| | |
|------|---|
| 研究背景 | This gene encodes a member of the interferon regulatory transcription factor (IRF) family. The encoded p protein is found in an inactive cytoplasmic form that upon serine/threonine phosphorylation forms a complex with CREBBP. This complex translocates to the nucleus and activates the transcription of interferons alpha and beta, as well as other interferon-induced genes. Alternatively spliced transcript variants encoding multiple isoforms have been observed for this gene. |
