靶点信息

研究背景	This gene encodes a key enzyme in catabolism of quinolinate, an intermediate in the tryptophan-nicotina mide adenine dinucleotide pathway. Quinolinate acts as a most potent endogenous exitotoxin to neurons . Elevation of quinolinate levels in the brain has been linked to the pathogenesis of neurodegenerative dis orders such as epilepsy, Alzheimer's disease, and Huntington's disease. Alternative splicing results in mul tiple transcript variants.
