靶点信息

研究背景	This gene encodes a member of the nucleotide-sugar transporter family. The encoded protein is a multi-pass membrane protein. It transports UDP-galactose from the cytosol into Golgi vesicles, where it serves as a glycosyl donor for the generation of glycans. Mutations in this gene cause congenital disorder of glycosylation type II _m (CDG2M). Multiple alternatively spliced transcript variants encoding distinct isoforms have been found for this gene.
