靶点信息

研究背景	This gene encodes a coiled-coil domain containing protein. The encoded protein may play a critical role in actin-cytoskeletal reorganization during facial morphogenesis. Mutations in this gene are a cause of obliq ue facial clefting-1. Alternatively spliced transcript variants encoding multiple isoforms have been observ ed for this gene. A read-through transcript composed of SPECC1L (sperm antigen with calponin homology and coiled-coil domains 1-like) and the downstream ADORA2A (adenosine A2a receptor) gene sequence h as been identified, but it is thought to be non-coding.
