靶点信息

研究背景	The WNT gene family consists of structurally related genes which encode secreted signaling proteins. The se proteins have been implicated in oncogenesis and in several developmental processes, including regul ation of cell fate and patterning during embryogenesis. This gene is a member of the WNT gene family. It is strongly expressed in the cell lines of promyelocytic leukemia and Burkitt's lymphoma. In addition, it an d another family member, the WNT6 gene, are strongly coexpressed in colorectal cancer cell lines. The g ene overexpression may play key roles in carcinogenesis through activation of the WNT-beta-catenin-TCF signaling pathway. This gene and the WNT6 gene are clustered in the chromosome 2q35 region.
