靶点信息

研究背景	This gene is ubiquitously expressed and encodes a full-length protein which has an N-terminal BTB domain followed by a BACK domain and six kelch-like repeats in the C-terminus. These kelch-like repeats promote substrate ubiquitination of bound proteins via interaction of the BTB domain with the CUL3 (cullin 3) component of a cullin-RING E3 ubiquitin ligase (CRL) complex. Mutations in this gene cause pseudohypoparathyroidism type IID (PHA2D); a rare Mendelian syndrome featuring hypertension, hyperkalemia and metabolic acidosis. Alternative splicing results in multiple transcript variants encoding distinct isoforms.
