## 靶点信息

研究背景	This gene encodes a member of the insulin-like growth factor 2 mRNA-binding protein family. The protein encoded by this gene contains four K homology domains and two RNA recognition motifs. It functions by binding to the mRNAs of certain genes, including insulin-like growth factor 2, beta-actin and beta-transdu cin repeat-containing protein, and regulating their translation. Two transcript variants encoding different i soforms have been found for this gene.
