靶点信息

研究背景	This gene is a member of the synapsin gene family. Synapsins encode neuronal phosphoproteins which a ssociate with the cytoplasmic surface of synaptic vesicles. Family members are characterized by common protein domains, and they are implicated in synaptogenesis and the modulation of neurotransmitter relea se, suggesting a potential role in several neuropsychiatric diseases. This member of the synapsin family plays a role in regulation of axonogenesis and synaptogenesis. The protein encoded serves as a substrate for several different protein kinases and phosphorylation may function in the regulation of this protein in t he nerve terminal. Mutations in this gene may be associated with X-linked disorders with primary neuron al degeneration such as Rett syndrome. Alternatively spliced transcript variants encoding different isofor ms have been identified.
