## 靶点信息

研究背景	This gene is a member of the host cell factor family and encodes a protein with five Kelch repeats, a fibro nectin-like motif, and six HCF repeats, each of which contains a highly specific cleavage signal. This nucle ar coactivator is proteolytically cleaved at one of the six possible sites, resulting in the creation of an N-te rминаl chain and the corresponding C-terminal chain. The final form of this protein consists of noncovalen tly bound N- and C-terminal chains. The protein is involved in control of the cell cycle and transcriptional r egulation during herpes simplex virus infection. Alternatively spliced variants which encode different prot ein isoforms have been described; however, not all variants have been fully characterized.
