靶点信息

研究背景	Transcriptional regulator involved in different processes such as glucose metabolism, aerobic glycolysis, muscle cell differentiation and autophagy (By similarity. Recognizes and binds the forkhead DNA sequence motif (5'-GTAAACA-3' and can both act as a transcription activator or repressor, depending on the context. Together with FOXK2, acts as a key regulator of metabolic reprogramming towards aerobic glycolysis, a process in which glucose is converted to lactate in the presence of oxygen (By similarity. Acts by promoting expression of enzymes for glycolysis (such as hexokinase-2 (HK2, phosphofructokinase, pyruvate kinase (PKLR and lactate dehydrogenase, while suppressing further oxidation of pyruvate in the mitochondria by up-regulating pyruvate dehydrogenase kinases PDK1 and PDK4 (By similarity.
