## 靶点信息

研究背景	This gene is a member of the beta-1,3-galactosyltransferase (beta3GalT) gene family. This family encode s type II membrane-bound glycoproteins with diverse enzymatic functions using different donor substrate s (UDP-galactose and UDP-N-acetylglucosamine) and different acceptor sugars (N-acetylglucosamine, gal actose, N-acetylgalactosamine). The beta3GalT genes are distantly related to the Drosophila Brainiac gen e and have the protein coding sequence contained in a single exon. The beta3GalT proteins also contain conserved sequences not found in the beta4GalT or alpha3GalT proteins. The carbohydrate chains synthe sized by these enzymes are designated as type 1, whereas beta4GalT enzymes synthesize type 2 carboh ydrate chains. The ratio of type 1:type 2 chains changes during embryogenesis. By sequence similarity, t he beta3GalT genes fall into at least two groups: beta3GalT4 and 4 other beta3GalT genes (beta3GalT1- 3, beta3GalT5). This gene is oriented telomere to centromere in close proximity to the ribosomal protein S18 gene. The functionality of the encoded protein is limited to ganglioseries glycolipid biosynthesis.
