## 靶点信息

研究背景	This gene encodes one member of a family of translation repressor proteins. The protein directly interact s with eukaryotic translation initiation factor 4E (eIF4E), which is a limiting component of the multisubunit complex that recruits 40S ribosomal subunits to the 5' end of mRNAs. Interaction of this protein with eIF4 E inhibits complex assembly and represses translation. This protein is phosphorylated in response to vari ous signals including UV irradiation and insulin signaling, resulting in its dissociation from eIF4E and activ ation of mRNA translation.
