This gene encodes a member of the receptor tyrosine kinase family of proteins and the product of the pro to-oncogene MET. The encoded preproprotein is proteolytically processed to generate alpha and beta sub units that are linked via disulfide bonds to form the mature receptor. Further processing of the beta subu nit results in the formation of the M10 peptide, which has been shown to reduce lung fibrosis. Binding of i ts ligand, hepatocyte growth factor, induces dimerization and activation of the receptor, which plays a rol e in cellular survival, embryogenesis, and cellular migration and invasion. Mutations in this gene are asso ciated with papillary renal cell carcinoma, hepatocellular carcinoma, and various head and neck cancers. Amplification and overexpression of this gene are also associated with multiple human cancers.
