靶点信息

研究背景	The WNT gene family consists of structurally related genes which encode secreted signaling proteins. The se proteins have been implicated in oncogenesis and in several developmental processes, including regul ation of cell fate and patterning during embryogenesis. This gene is a member of the WNT gene family. It may be involved in breast cancer, and its protein signaling is likely a molecular switch that governs adipo genesis. This protein is 96% identical to the mouse Wnt10b protein at the amino acid level. This gene is cl ustered with another family member, WNT1, in the chromosome 12q13 region.
