靶点信息

| | |
|------|---|
| 研究背景 | The protein encoded by this gene is a bZIP transcription factor which can bind as a homodimer to certain DNA regulatory regions. It can also form heterodimers with the related protein CEBP-delta. The encoded p rotein may be essential for terminal differentiation and functional maturation of committed granulocyte p rogenitor cells. Mutations in this gene have been associated with Specific Granule Deficiency, a rare cong enital disorder. Multiple variants of this gene have been described, but the full-length nature of only one has been determined. |
