靶点信息

研究背景	The modification of proteins with ubiquitin is an important cellular mechanism for targeting abnormal or s hort-lived proteins for degradation. Ubiquitination involves at least three classes of enzymes: ubiquitin-ac tivating enzymes, ubiquitin-conjugating enzymes, and ubiquitin-protein ligases. This gene encodes a me mber of the E2 ubiquitin-conjugating enzyme family. This enzyme is required for post-replicative DNA da mage repair, and may play a role in transcriptional regulation. Mutations in this gene are associated with mental retardation. Alternative splicing results in multiple transcript variants.
