靶点信息

研究背景	This gene encodes a nuclear protein that belongs to the PBX homeobox family of transcriptional factors. S studies in mice suggest that this gene may be involved in the regulation of osteogenesis and required for s keletal patterning and programming. A chromosomal translocation, t(1;19) involving this gene and TCF3/ E2A gene, is associated with pre-B-cell acute lymphoblastic leukemia. The resulting fusion protein, in whi ch the DNA binding domain of E2A is replaced by the DNA binding domain of this protein, transforms cells by constitutively activating transcription of genes regulated by the PBX protein family. Alternatively splice d transcript variants encoding different isoforms have been found for this gene.
