### 靶点信息

研究背景	Ubiquitin-conjugating E2 enzyme variant proteins constitute a distinct subfamily within the E2 protein fa mily. They have sequence similarity to other ubiquitin-conjugating enzymes but lack the conserved cystei ne residue that is critical for the catalytic activity of E2s. The protein encoded by this gene is located in th e nucleus and can cause transcriptional activation of the human FOS proto-oncogene. It is thought to be i nvolved in the control of differentiation by altering cell cycle behavior. Alternatively spliced transcript vari ants encoding multiple isoforms have been described for this gene, and multiple pseudogenes of this gen e have been identified. Co-transcription of this gene and the neighboring upstream gene generates a rare transcript (Kua-UEV), which encodes a fusion protein comprised of sequence sharing identity with each in dividual gene product.
