靶点信息

研究背景	This gene encodes a member of the subtilisin-like proprotein convertase family, which includes proteases that process protein and peptide precursors trafficking through regulated or constitutive branches of the secretory pathway. The encoded protein undergoes an initial autocatalytic processing event in the ER to generate a heterodimer which exits the ER. It then sorts to the trans-Golgi network where a second autoc atalytic event takes place and the catalytic activity is acquired. This encoded protein is widely expressed and one of the seven basic amino acid-specific members which cleave their substrates at single or paired basic residues. It mediates posttranslational endoproteolytic processing for several integrin alpha subunit s and is thought to process prorenin, pro-membrane type-1 matrix metalloproteinase and HIV-1 glycoprot ein gp160. Alternative splicing results in multiple transcript variants, some of which encode distinct isofor ms, including a protease packaged into dense core granules (PC5A) and a type 1 membrane bound prote ase (PC5B).
