靶点信息

研究背景	The modification of proteins with ubiquitin is an important cellular mechanism for targeting abnormal or s hort-lived proteins for degradation. Ubiquitination involves at least three classes of enzymes: ubiquitin-ac tivating enzymes (E1s), ubiquitin-conjugating enzymes (E2s) and ubiquitin-protein ligases (E3s). This gen e encodes a member of the E2 ubiquitin-conjugating enzyme family. This enzyme is highly similar in prim ary structure to the enzyme encoded by the UBE2L3 gene. Two alternatively spliced transcript variants en coding distinct isoforms have been found for this gene.
