## 靶点信息

研究背景	The protein encoded by this gene is highly expressed in late-pregnancy serum and is similar in structure t o alpha-2-macroglobulin. The encoded protein, which acts as a homotetramer, inhibits the activity of all f our classes of proteinases. This protein contains cleavage sites for several proteinases. Upon binding of a proteinase, the conformation of this protein changes to trap the proteinase, limiting its activity. This protein appears to be elevated in the sera of presymptomatic Alzheimer's disease patients.
