靶点信息

研究背景	The protein encoded by this gene is an unusual orphan receptor that contains a putative ligand-binding d omain but lacks a conventional DNA-binding domain. The gene product is a member of the nuclear horm one receptor family, a group of transcription factors regulated by small hydrophobic hormones, a subset of which do not have known ligands and are referred to as orphan nuclear receptors. The protein has been shown to interact with retinoid and thyroid hormone receptors, inhibiting their ligand-dependent transcriptional activation. In addition, interaction with estrogen receptors has been demonstrated, leading to in hibition of function. Studies suggest that the protein represses nuclear hormone receptor-mediated trans activation via two separate steps: competition with coactivators and the direct effects of its transcription al repressor function.
