靶点信息

| 研究背景 | There are approximately 40 known eukaryotic LIM proteins, so named for the LIM domains they contain. L IM domains are highly conserved cysteine-rich structures containing 2 zinc fingers. Although zinc fingers usually function by binding to DNA or RNA, the LIM motif probably mediates protein-protein interactions. LIM kinase-1 and LIM kinase-2 belong to a small subfamily with a unique combination of 2 N-terminal LIM motifs and a C-terminal protein kinase domain. LIMK1 is a serine/threonine kinase that regulates actin pol ymerization via phosphorylation and inactivation of the actin binding factor cofilin. This protein is ubiquito usly expressed during development and plays a role in many cellular processes associated with cytoskele tal structure. This protein also stimulates axon growth and may play a role in brain development. LIMK1 h emizygosity is implicated in the impaired visuospatial constructive cognition of Williams syndrome. Altern ative splicing results in multiple transcript variants encoding distinct isoforms. |
