靶点信息

研究背景	This gene encodes a nuclear transcription factor that belongs to the NK-linked or NK-like (NKL) subfamily of homeobox genes. The encoded protein is required for normal development of the spleen during embry ogenesis. This protein is also involved in specification of neuronal cell fates. Ectopic expression of this gen e due to chromosomal translocations is associated with certain T-cell acute lymphoblastic leukemias. Alte rnate splicing results in multiple transcript variants.
