靶点信息

研究背景	This gene encodes a transcription factor that is a member of the leucine zipper family of DNA binding pro teins. The encoded protein has been identified as a moonlighting protein based on its ability to perform m echanistically distinct functions This protein binds to the cAMP-responsive element (CRE), an octameric p alindrome. It forms a homodimer or a heterodimer with c-Jun and stimulates CRE-dependent transcription . This protein is also a histone acetyltransferase (HAT) that specifically acetylates histones H2B and H4 in vitro; thus it may represent a class of sequence-specific factors that activate transcription by direct effect s on chromatin components. The encoded protein may also be involved in cell's DNA damage response in dependent of its role in transcriptional regulation. Several alternatively spliced transcript variants have b een found for this gene [provided by RefSeq, Jan 2014]
