靶点信息

研究背景	The Sec61 complex is the central component of the protein translocation apparatus of the endoplasmic r eticulum (ER) membrane. Oligomers of the Sec61 complex form a transmembrane channel where protein s are translocated across and integrated into the ER membrane. This complex consists of three membran e proteins- alpha, beta, and gamma. This gene encodes the beta-subunit protein. The Sec61 subunits are also observed in the post-ER compartment, suggesting that these proteins can escape the ER and recycle back. There is evidence for multiple polyadenylated sites for this transcript.
