靶点信息

| 研究背景 | The protein encoded by this gene is a member of the Toll-like receptor (TLR) family which plays a fundam ental role in pathogen recognition and activation of innate immunity. TLRs are highly conserved from Dro sophila to humans and share structural and functional similarities. They recognize pathogen-associated molecular patterns (PAMPs) that are expressed on infectious agents, and mediate the production of cytok ines necessary for the development of effective immunity. The various TLRs exhibit different patterns of expression. This gene is ubiquitously expressed, and at higher levels than other TLR genes. Different leng th transcripts presumably resulting from use of alternative polyadenylation site, and/or from alternative s plicing, have been noted for this gene. |
