靶点信息

研究背景	Protein tags are peptide sequences genetically grafted onto a recombinant protein. Often these tags are r emovable by chemical agents or by enzymatic means, such as proteolysis or intein splicing. Tags are atta ched to proteins for various purposes.Epitope tags are short peptide sequences which are chosen becaus e high-affinity antibodies can be reliably produced in many different species. These are usually derived fr om viral genes, which explain their high immunoreactivity. Epitope tags include V5-tag, Myc-tag, HA-tag and NE-tag. These tags are particularly useful for western blotting, immunofluorescence and immunoprec ipitation experiments, although they also find use in antibody purification.
