

DTNB

货号: B26677

产品信息

生物活性	DTNB (Ellman's Reagent) is a chemical used to quantify the number or concentration of thiol groups.
CAS	69-78-3
中文名称	Ellman试剂
分子量	396.35
体外研究	<p>DTNB reacts with the free sulphydryl side chain of cysteine to form an S-S bond between the protein and a thionitrobenzoic acid (TNB) residue.</p> <p>The main advantage of DTNB over alternative reagents (e.g., N-ethylmaleimide or iodoacetamide) is in the selectivity of this reagent and in the ability to follow the course of the reaction spectrophotometrically.</p> <p>Modification of Enzyme with DTNB:</p> <p>Modification of the SH groups of the enzyme is carried out by reacting 10 µL of 10 mM DTNB solution (about a 20-fold molar excess) at room temperature with 0.6 mL of enzyme solution (0.807 mg/mL) in 80 mM phosphate buffer, pH 8.0, containing 1 mM EDTA, which has been dialyzed previously against the same buffer solution for 24 h. The number of SH groups is estimated from the increase of absorbance at 410 nm using a molar extinction coefficient of 13,600 M⁻¹cm⁻¹ for thionitrobenzoate ions liberated.</p> <p>The accuracy of these methods have not been independently confirmed. They are for reference only.</p>
