靶点信息

研究背景	This gene encodes a member of the DEAH-containing family of RNA helicases. The encoded protein is an enzyme that catalyzes the ATP-dependent unwinding of double-stranded RNA and DNA-RNA complexes. T his protein localizes to both the nucleus and the cytoplasm and functions as a transcriptional regulator. T his protein may also be involved in the expression and nuclear export of retroviral RNAs. Alternate splicin g results in multiple transcript variants. Pseudogenes of this gene are found on chromosomes 11 and 13.[provided by RefSeq, Feb 2010]
