靶点信息

| 研究背景 | This gene encodes a protein that is a member of the mucin family. Mucins are high molecular weight, O-g lycosylated proteins that play an important role in forming a protective mucous barrier, and are found on the apical surfaces of the epithelia. The encoded protein is a membrane-tethered mucin that contains an extracellular domain at its amino terminus, a large tandem repeat domain, and a transmembrane domain with a short cytoplasmic domain. The amino terminus is highly glycosylated, while the repeat region cont ains 156 amino acid repeats unit that are rich in serines, threonines, and prolines. Interspersed within the repeats are Sea urchin sperm protein Enterokinase and Agrin (SEA) modules, leucine-rich repeats and an kyrin (ANK) repeats. These regions together form the ectodomain, and there is a potential cleavage site f ound near an SEA module close to the transmembrane domain. This protein is thought to play a role in fo rming a barrier, protecting epithelial cells from pathogens. Products of this gene have been used as a ma rker for different cancers, with higher expression levels associated with poorer outcomes. |
