靶点信息

研究背景	The protein encoded by this gene is a small GTPase of the Rho-subfamily, which regulates signaling path ways that control diverse cellular functions including cell morphology, migration, endocytosis and cell cyc le progression. This protein is highly similar to Saccharomyces cerevisiae Cdc 42, and is able to complem ent the yeast cdc42-1 mutant. The product of oncogene Dbl was reported to specifically catalyze the diss ociation of GDP from this protein. This protein could regulate actin polymerization through its direct bindi ng to Neural Wiskott-Aldrich syndrome protein (N-WASP), which subsequently activates Arp2/3 complex. Alternative splicing of this gene results in multiple transcript variants. Pseudogenes of this gene have bee n identified on chromosomes 3, 4, 5, 7, 8 and 20. [provided by RefSeq, Apr 2013]
