靶点信息

研究背景	The protein encoded by this gene belongs to the highly conserved cyclin family, whose members are char acterized by a dramatic periodicity in protein abundance through the cell cycle. Cyclins function as regula tors of CDK kinases. Different cyclins exhibit distinct expression and degradation patterns which contribut e to the temporal coordination of each mitotic event. This cyclin forms a complex with and functions as a regulatory subunit of CDK2, whose activity is required for cell cycle G1/S transition. This protein accumula tes at the G1-S phase boundary and is degraded as cells progress through S phase. Overexpression of thi s gene has been observed in many tumors, which results in chromosome instability, and thus may contrib ute to tumorigenesis. This protein was found to associate with, and be involved in, the phosphorylation of NPAT protein (nuclear protein mapped to the ATM locus), which participates in cell-cycle regulated histon e gene expression and plays a critical role in promoting cell-cycle progression in the absence of pRB.
