靶点信息

| 研究背景 | Proper cohesion of sister chromatids is a prerequisite for the correct segregation of chromosomes during cell division. The cohesin multiprotein complex is required for sister chromatid cohesion. This complex is composed partly of two structural maintenance of chromosomes (SMC) proteins, SMC3 and either SMC1B or the protein encoded by this gene. Most of the cohesin complexes dissociate from the chromosomes bef ore mitosis, although those complexes at the kinetochore remain. Therefore, the encoded protein is thou ght to be an important part of functional kinetochores. In addition, this protein interacts with BRCA1 and i s phosphorylated by ATM, indicating a potential role for this protein in DNA repair. This gene, which belon gs to the SMC gene family, is located in an area of the X-chromosome that escapes X inactivation. Mutati ons in this gene result in Cornelia de Lange syndrome. Alternative splicing results in multiple transcript va riants encoding different isoforms. [provided by RefSeq, Jul 2013] |
