靶点信息

研究背景	The protein encoded by this gene functions as a protein ubiquitin ligase and is a component of the multip rotein APC complex. The APC complex is a cyclin degradation system that governs exit from mitosis by ta rgeting cell cycle proteins for degredation by the 26S proteasome. Each component protein of the APC complex is highly conserved among eukaryotic organisms. This protein, and other APC complex proteins, contain a tetratricopeptide repeat (TPR) domain; a protein domain that is often involved in protein-protein interactions and the assembly of multiprotein complexes. Multiple alternatively spliced transcript variants, encoding distinct proteins, have been identified. [provided by RefSeq, Jan 2016]
